# DISCLAIMER

The information provided herein reflects the views of the Energy Research Office (Empresa de Pesquisa Energética – EPE). However, the content presented involves a range of known and unknown risks and uncertainties. Therefore, the data and analyses contained in this document should be used for reference purposes only and do not constitute a guarantee of future outcomes or events.

This document is informational in nature and is intended to support national energy sector planning. Accordingly, any decisions regarding follow-up actions, such as the formulation of public policies, the definition of strategic guidelines, investment decisions, or business strategies, fall under the responsibility of other public and private institutions.

EPE disclaims any liability for actions or decisions taken by economic agents or any other parties based on the information contained in this document.

## PUBLIC VALUE

EPE conducts studies and research to support the formulation, implementation, and evaluation of Brazil's energy policy and planning.

Within the decarbonization agenda, EPE contributes to improving the quality of the debate and supporting decision-making on carbon capture, transport, utilization, and geological storage pathways in Brazil, through the organization and systematization of relevant technical information.

The second edition of this publication expands and updates the database, incorporating methodological enhancements designed to more accurately reflect the geological, productive, and logistical diversity of the country's different regions. Acknowledging the limitations inherent to this exercise, the document is presented as a technical reference to support planning and the prioritization of opportunities across carbon capture and storage pathways, while also helping to reduce information asymmetries among institutions, sector stakeholders, and society at large.

### CCS PROJECTS AND CAPTURE CAPACITY WORLDWIDE, IN 2025

Sources: [GCCSI \(2025\)](#) and [IEA \(abr/2025\)](#)

Source: [GCCSI \(2025\)](#)

<sup>1</sup> The acronym CCS (carbon capture and storage) is used as an umbrella term to encompass the different pathways involving CO<sub>2</sub> capture—whether from point sources or directly from the atmosphere—its transport, and its storage, whether permanent or not (thus including utilization pathways).

Global Landscape of CCS Pathways

National Context 2024-2025

Objectives and Action Pillars of the EPE Project

Methodology and Impacts

The Brazilian Perspective

Regional Analyses

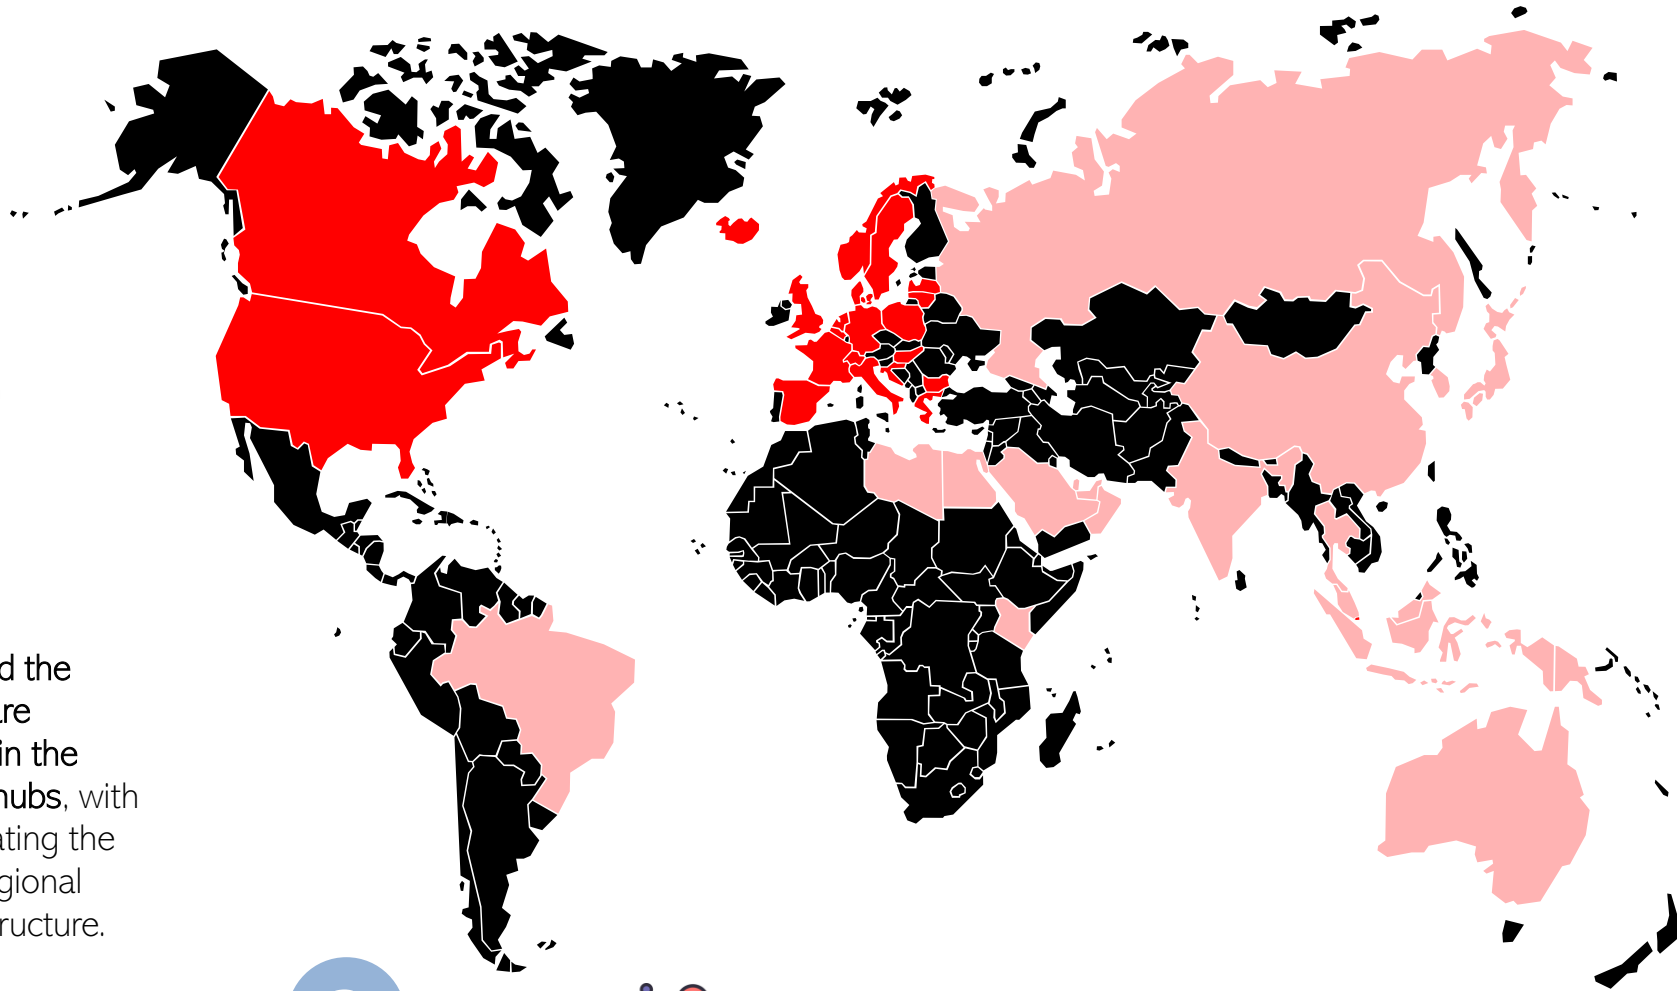

Final Remarks

By the end of the decade...

1

North America and the European Union are expected to remain the main global CCS hubs, with the latter accelerating the deployment of regional hub-based infrastructure.

2

Employment growth associated with projects in:

HYDROGEN

LOW-CARBON AMMONIA

POWER GENERATION

INDUSTRIAL HEAT

3

The integration of CCS with natural gas-fired power plants enables the provision of firm, competitive, and low-carbon electricity, a relevant attribute to support the projected expansion of artificial intelligence data centers.

### CLIMATE PLAN AND THE ROLE OF CCS PATHWAYS IN BRAZIL

In the Climate Plan (2024–2035), BECCS and CCS/CCUS are addressed as relevant pathways to support the achievement of climate targets, by enabling both emissions mitigation in hard-to-abate sectors and the compensation of residual emissions over the long term (**MMA, 2025**).

Four related structural actions are identified:

CCS/CCUS<sup>1</sup>

ENR.E.08 - Develop Carbon Capture, Transport, Use, and Storage

BECCS

ENR.E.09 – Develop bioenergy production with carbon capture and storage (Bio-CCS)

ENR.E.10 – Strengthen biomass production for energy use

ENR.E.13 – Promote infrastructure for carbon dioxide transport and storage

<sup>1</sup> CCS and CCUS solutions are linked to a specific long-term structural action (ENR.E.08), which is directly influenced by other actions, such as ENR.E.13

## Objective

### MAPPING

Update the relevance map for carbon capture, transport, and geological storage, integrating the technical and economic evidence currently available in Brazil

## Axis 1

### METHODOLOGY

Enhance the methodology developed since the first cycle (published in 2024), expanding the capacity for data extraction, qualification, and interpretation

## Axis 2

### HOTSPOTS AND ROUTES

Identify and differentiate hotspots suitable for different pathways (CCS, BECCS, DACCS, and CCUS), considering geological and logistical conditions

## Axis 3

### INDUSTRIAL SECTORS

Map sector-specific opportunities and challenges, supporting the assessment of carbon capture and storage pathways as an industrial decarbonization strategy

## Axis 4

### PLANNING

Strengthen EPE's contribution to CCS/BECCS/DACCS/CCUS planning, enhancing coherence between public policy guidelines and regional realities

## Axis 5

### INTEGRATION

Consolidate EPE as a national reference by connecting CCUS to other decarbonization alternatives in the energy and industrial sectors

Global Landscape of CCS Pathways

Methodology and Impacts

The Brazilian Perspective

Regional Analyses

Final Remarks

## POTENTIAL CCS/CCUS DEMANDERS

Identifies industrial facilities facing greater decarbonization challenges and, therefore, with a higher likelihood of considering CCS/CCUS as a mitigation pathway. It highlights the spatial distribution of major emission sources, enabling the identification of industrial clusters with potential to support hubs, shared infrastructure, and systemic cost reductions—while also indicating where higher demand for carbon credits may emerge.

Seven sectors are considered: steel, cement, oil and gas (O&G) production, refining, chemical industry, mining, and fossil-fuel-fired thermal power plants (TPPs). For steel, cement, chemicals, and mining, emissions estimated for 2024 are used; for O&G production and refining, 2023 data are adopted. In the case of fossil TPPs, only plants operating between 2021 and 2025 are included, using the period average to reduce the influence of hydrological variability on thermal dispatch.

## BECCS - POTENTIAL AVAILABILITY OF BIOGENIC CO<sub>2</sub>

Broadens the analysis to less immediate opportunities associated with future expansion - such as new ethanol plants and increased biomethane production - as well as sources requiring additional capture infrastructure (e.g., cogeneration exhaust gases or processes with more diluted CO<sub>2</sub> streams, such as pulp and paper industries).

Supports medium-term planning by indicating where BECCS may expand through more robust investments and industrial integration, helping anticipate infrastructure needs (transport and storage) and policy measures required to enable scale-up.

## BECCS - IMMEDIATE AVAILABILITY OF BIOGENIC CO<sub>2</sub>

Represents currently available biogenic CO<sub>2</sub> sources (based on actual 2024 production) that generate relatively pure and concentrated streams - particularly from ethanol fermentation (sugarcane and corn) and biomethane-related pathways. Given their lower capture complexity, these sources tend to require more limited investments (e.g., compression, logistics, and storage).

Functions as a short-term prioritization indicator for BECCS, identifying where projects are more likely to be deployed rapidly, accelerating learning effects, market development, and the potential large-scale generation of negative emissions.

## STORAGE SITES

Qualitatively identifies geological formations with potential for subsurface CO<sub>2</sub> storage. Three main classes are considered: (i) depleted or depleting oil and gas fields, (ii) saline reservoirs, and (iii) mafic/ultramafic rocks with mineralization potential (storage via chemical reaction).

Applies minimum viability criteria: the presence of a geological seal (to reduce leakage risk); a typical depth of ≥ 800 m for depleted fields and saline reservoirs (conditions under which CO<sub>2</sub> tends to remain in a supercritical state); and a differentiated criterion of ≥ 400 m for mafic/ultramafic rocks, reflecting the nature of mineral trapping mechanisms.

## KNOWLEDGE FRAMEWORK

Shows where geological and geophysical data are available to support more reliable technical decisions regarding geological CO<sub>2</sub> storage. It serves as an indicator of subsurface knowledge maturity, combining the presence of exploratory wells and 2D/3D seismic surveys.

In practice, it helps distinguish areas with higher uncertainty (limited data) from better-characterized regions (more extensive data), supporting the prioritization of investments in additional studies, exploratory campaigns, and risk reduction ahead of demonstration or commercial projects.

## TRANSPORT INFRASTRUCTURE

Indicates the presence of infrastructure capable of enabling CO<sub>2</sub> transport from capture points to geological storage sites and/or utilization locations. The focus is on transport modes with established use or applicability in international projects: pipelines, port facilities, roads, and railways.

The underlying assumptions aim to reflect operational feasibility; for instance, port facilities with incompatible uses (e.g., tourism) and unpaved road networks that would hinder sustainable CO<sub>2</sub> transport by trucks are excluded. This layer is a key input for understanding costs, scale, and connectivity of potential hubs.

Global Landscape of CCS Pathways

National Context 2024–2025

Objectives and Action Pillars of the EPE Project

Methodology and Impacts

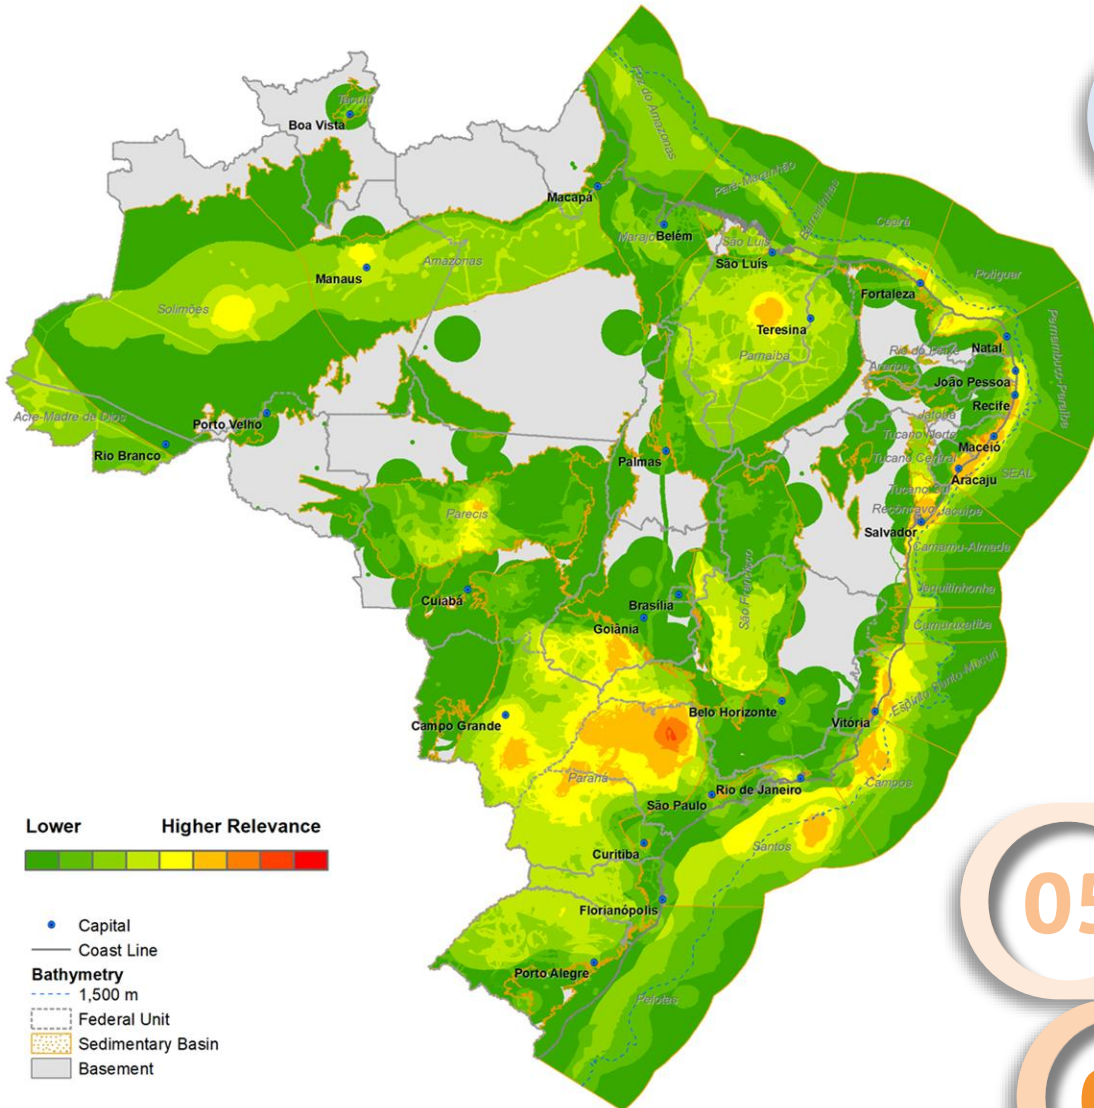

The Brazilian Perspective

Regional Analyses

Final Remarks

01

### EXPLORATORY AND QUALITATIVE NATURE

The map is intended to indicate territorial trends that must be validated through project-specific analyses. It is reinforced that permanent storage is the priority, while CO<sub>2</sub> utilization is considered an additional benefit.

02

### DIVERSITY OF STORAGE SITES

An increase in geological heterogeneity among basins is observed, with particular emphasis on proximal portions of offshore basins, regions with depleted oil and gas fields, and emerging prospects in basins such as the Paraná Basin.

03

### DATA AND INFRASTRUCTURE BOTTLENECKS

Limited data availability in inland areas and the lack of dedicated CO<sub>2</sub> transport infrastructure remain key bottlenecks to the advancement of CCS pathways. Connecting emission sources to geologically secure and technically robust sinks is essential!

04

### SHARED INFRASTRUCTURE AND HYBRID LOGISTICS

The development of hubs with shared compression and transport infrastructure is strategic to dilute costs and attract investors, while the combination of different transport modes helps overcome regional challenges and connect isolated emitters.

05

### BIOENERGY AS A LEVER

The availability of high-purity CO<sub>2</sub> streams, combined with expansion potential, technological maturity, and integration with climate policies, positions the bioenergy sector as strategic for scaling up BECCS. Estimates from the PNE 2055 indicate a removal potential of over 140 MtCO<sub>2</sub>eq associated with the production of liquid biofuels and biomethane.

06

### OPORTUNIDADES PARA AS EMISSÕES INDUSTRIAIS

The proximity between major emission hubs and areas with storage potential, combined with growing competitive pressures from policies such as the Carbon Border Adjustment Mechanism (CBAM), underscores the need to accelerate CO<sub>2</sub> hubs, with CCUS acting as a strategic solution to decarbonize hard-to-abate sectors.

## FAVORABLE FACTORS

Availability of a diverse set of storage sites of presumed good geological quality.  
 Good coverage of geological and geophysical data, supporting the pre-screening of priority areas.  
 Concentration of the country's most extensive network of pipelines, roads, and ports.  
 Large volume of emissions from industrial activities and the sugar-energy sector.  
 Long-standing experience with continuous CO<sub>2</sub> injection for EOR.

## KEY CHALLENGES

Storage sites located in ultra-deep waters pose logistical and cost challenges for offshore storage.

## MARKET SIGNALS

Growth in multi-sector memoranda of understanding and letters of intent, covering both onshore and offshore basins.

## POTENTIAL CCS/CCUS DEMANDERS

20,2 MtCO<sub>2</sub>

## FAVORABLE FACTORS

Abundance of biomass, including sugarcane and corn fermentation, as well as biomethane and CO<sub>2</sub> streams from the pulp and paper industry. Potential storage sites in the Paraná Basin basalts, with prospects for CO<sub>2</sub> mineralization. Good coverage of geological and geophysical surveys. Extensive transport network, supported by roads and pipelines

## KEY CHALLENGES

Need to demonstrate the viability of different storage site options and to expand data coverage toward inland areas.

## COMPETITIVE ADVANTAGE

Decarbonization of the pork and animal protein export value chains supports competitiveness by helping overcome carbon-related barriers in global markets

## REGIONAL VOCATION

The region's unique forest cover has historically posed challenges to the deployment of transport infrastructure and limited the availability of geological data. Nature-based Solutions (NbS) should therefore constitute the primary axis of climate action in the territory

## OPPORTUNITIES

A tendency toward site-specific projects (notably in Amazonas and Pará, near the Maranhão border), with the potential development of isolated hubs. Utilization of captured CO<sub>2</sub> as a value-added input, fostering local markets and reducing logistical dependencies

## INNOVATION

Initiatives such as the Vale/Circlua project, which focuses on converting tailings from the Carajás Complex into low-emission cement, enhance circularity and expand the range of opportunities associated with the carbon capture and storage value chain

## TARGET INDUSTRIES

Global Landscape of CCS Pathways

National Context 2024–2025

Objectives and Action Pillars of the EPE Project

Methodology and Impacts

The Brazilian Perspective

Regional Analyses

Final Remarks

### Favorable Ecosystem

Brazil brings together geography, technical capacity, public policy, and growing private-sector interest to scale up CCS and position itself as a leader in the supply of low-carbon commodities

### Logistics

The lack of dedicated CO<sub>2</sub> transport infrastructure remains one of the country's main bottlenecks. While coastal concentration facilitates large-scale transport solutions, inland expansion requires robust technical solutions and clear regulatory frameworks. The acceleration of shared hub-based infrastructure is essential

### Strength of BECCS

The bioenergy sector combines readily available high-purity CO<sub>2</sub> streams with strong expansion potential, supported by a sustainable biomass supply, technological maturity, and long-standing integration with climate and carbon-pricing policies. In this context, Brazil holds a privileged position to scale up the BECCS pathway globally

### Regional Assessment

The Southeast and Northeast regions show high feasibility for industrial hubs, combining legacy O&G infrastructure, emission concentration, and proximity to high-quality storage sites. The Center-West and South regions stand out for BECCS-oriented agro-industrial applications, but depend on advances in basin-specific geological data and transport infrastructure, particularly pipelines

### Utilization as a co-benefit

CO<sub>2</sub> utilization tends to follow emission hubs but should act as an additional benefit, rather than the primary driver of initial CCS investments

### National Potential

The integration of available evidence confirms Brazil's capability to capture, transport, and store CO<sub>2</sub>, while highlighting the need for expanded cooperation to advance metrics, governance, and project development

### Favorable Opportunity

Brazil presents favorable conditions to advance multiple CCS pathways, with applications across the energy and industrial sectors. The realization of this potential requires the coordinated acceleration of policies and projects, supported by risk-mitigation instruments, first-of-a-kind project deployment, and market creation, in order to enable scale and effectively contribute to climate targets. Integration with other decarbonization strategies is possible and necessary
